TOPIC 6 - DIFFERENCE BETWEEN EQUITY IRR AND PROJECT IRR

1. INTRODUCTION AND OBJECTIVE

This article attempts to discuss on the difference between equity IRR and project IRR which are commonly computed in the appraisal of an independent power plant when discounted cash flow technique is used.

<table>
<thead>
<tr>
<th>Type of Cash Flow</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Free Cash Flow to Equity (FCFE)</td>
<td>The Internal Rate of Return (IRR), as determined using the net cash flow from FCFE is known as the equity IRR.</td>
</tr>
<tr>
<td>Free Cash Flow to Firm (FCFF)</td>
<td>The Internal Rate of Return (IRR), as determined using the net cash flow from FCFF is known as the project IRR</td>
</tr>
</tbody>
</table>

2. INTERPRETATION OF RESULTS

**EQUITY IRR**

<table>
<thead>
<tr>
<th>EQUITY IRR - COST OF EQUITY</th>
<th>INVESTMENT DECISION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Negative</td>
<td>This means that based on the set of assumptions used, the independent power plant under evaluation is unable to generate the required rate of return by the investor / project sponsor. Hence, the decision should be to reject the investment.</td>
</tr>
<tr>
<td>Zero</td>
<td>This means that based on the set of assumptions used, the independent power plant under evaluation generates the required rate of return by the investor / project sponsor.</td>
</tr>
<tr>
<td>Positive</td>
<td>This means that based on the set of assumptions used, the independent power plant under evaluation generates more than the required rate of return</td>
</tr>
</tbody>
</table>
by the investor / project sponsor. Hence, the decision should be to accept the investment project based solely from financial perspective.

### PROJECT IRR

<table>
<thead>
<tr>
<th>PROJECT IRR - WEIGHTED AVERAGE COST OF CAPITAL (WACC)</th>
<th>INVESTMENT DECISION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Negative</td>
<td>This means that based on the set of assumptions used, the independent power plant under evaluation is unable to generate the required rate of return by the providers of capital based on the proposed target funding structure. Hence, the decision should be to reject the investment.</td>
</tr>
<tr>
<td>Zero</td>
<td>This means that based on the set of assumptions used, the independent power plant under evaluation generates the required rate of return by the providers of capital based on the proposed target funding structure.</td>
</tr>
<tr>
<td>Positive</td>
<td>This means that based on the set of assumptions used, the independent power plant under evaluation generates more than the required rate of return by the providers of capital based on the proposed target funding structure. Hence, the decision should be to accept the investment project based solely from financial perspective.</td>
</tr>
</tbody>
</table>

As Equity IRR represents the degree the returns of a project to the providers of equity capital, i.e. Cost of Equity, which is higher than WACC, for a given set of computation, Equity IRR is always higher than Project IRR, for profitable investments.
